## ABSTRACT OF THE DISCLOSURE

The present invention relates to fabric and textile conditioning compositions
with improved particulate soil cleaning, containing particular combinations of
cationic polymers and anionic surfactants in combination with a
polyvinylpyrrolidone/amphiphilic carboxy containing polymer anti-redeposition
system. The cationic polymers are preferably below a particular molecular weight to
afford optimal cleaning and conditioning, and must be present in an effective
amount to yield a substantial conditioning benefit. A method of conditioning articles
using the inventive compositions is also disclosed.
